SPECOM M

SPECOM C

## Description

To optimise the operation of electrical networks, following tasks must be done simultaneously:

- accuracy of controlling and measuring
- efficiency of preventive monitoring
- speed in malfunction detection and analysis
- optimisation of utilisation ranges

The ability to achieve those performances is subject to the possibility to analyse and master the main parameters of the electrical network.

In order to reply even more efficiently to the requirements of the market, our range of network analysers is today constituted of:

- a range of modular products for DIN rail mounting: SPECOM M
- a range of products for panel mounting at the 144 x 144 mm format: SPECOM C

It is also important to note the evolution possibilities of the SPECOM C range. A large range of interchangeable modules allows a permanent evolution of the products capabilities at the lowest modification costs.

SPECOM ensures to the electrical installation 'Management' and 'Communication'.

## Communication

SPECOM C et SPECOM M measure and display continuously three different parameters of the electrical network. The instantaneous, average, maximum and minimum values can be consulted locally by means of a four keys keyboard on a LED screen (SPECOM C) or LCD screen (SPECOM M). The combination of SPECOM C30, SPECOM M10, SPECOM M30, SPECOM M40 with the software SPECOM L allows the centralisation and exploitation of all the measurements.

## Management

SPECOM is a management unit that ensures simultaneously:

- the true RMS measurement of all electrical parameters (voltage, current, power factor as well as the frequency on the network).
- the calculation of active and reactive power and energy per phase and global.
- the calculation of the harmonics rate per phase (current and voltage). All the harmonics up to rank 15 are considered in the calculation.
- the storage in memory of maximum values of intensity, power, active and reactive energy per phase and global.
- economy and service improvement by incident prevention, consumption adaptation to tariff system and accurate consumption cost allocation.

## Operation

### Measurements

For each of the three phases, the SPECOM C and SPECOM M units measure the true RMS values of:

- current on 5 amps isolated input. This requires external 5 amps current transformers. The accuracy of the measurement is directly linked to the current transformer's accuracy. The ratio is programmable from 1 to 10000.
- voltage phase to neutral or phase to phase. The connection of the neutral is facultative. The ratio is programmable from 1 to 100000.
- frequency on phase 1.
- power factor.

From these measurements, SPECOM calculates the active and reactive energy per phase and global. All those parameters are available in instantaneous values each second and on a mobile average period programmable from 1 to 60 minutes.

## SPECOM C

## SPECOM C

### Aspect

- normalised DIN 43700 enclosure (144 x 144 x 58 mm)
- slider fixation system
- connection on the rear on one terminal block
- built-in relay protection degree: IP41
- protection degree at the terminal location: IP20

### Power supply

230 or 400V CA 50/60Hz  
On request, other possibilities are available

### Power consumption 3VA

### Local interface

- green LED display
- permanent display of three parameters
- four keys keyboard
- automatic display of the metering units

### Display

Minimum, average and maximum values for voltages, currents, powers and power factor.

### Maximum values to apply

- connection between phase and neutral: 500V AC RMS
- connection between phases: 866V AC RMS
- maximum current: 6A RMS

### Insulation

- power supply and measurement unit: 5kV
- measurement inputs: 2.5kV
- alarm contact, data communication and earth: 1kV

### Pulse outputs / Alarm outputs (Specom C40)

- maximum admissible current: 120mA
- maximum peak voltage: 300V
- programmable weight of pulse
- programmable width of pulse

### Environment

- operational temperature: 0°C up to +50°C
- storage temperature: -20°C up to +80°C

### Standards IEC 664, VDE 0110, UL 94, IEC 801, IEC 348 and IEC 571.1

### Accuracy

% of the measured parameter in case of ambient temperatures between +5°C and +45°C

Parameter	Accuracy	Resolution
Single voltage	± 0.5%	± 2 digits
Compound voltage	± 0.5%	± 2 digits
Current	± 0.5%	± 2 digits
Active power	± 1%	± 2 digits
Reactive power	± 1%	± 2 digits
Active energy	± 1%	± 2 digits
Reactive energy	± 1%	± 2 digits
Power factor	± 1%	± 2 digits
Frequency	± 0.1%	± 2 digits
Clock		± 2 digits

### Pulse output/Alarm output

The SPECOM C40 unit gives possibility to configure two relay outputs either as pulse outputs or as alarm outputs. Each pulse output is assigned to the two active and reactive energy counters. The alarm outputs are programmable and can be assigned to one of the numerous parameters measured by the unit.

Any overshoot of alarm thresholds will induce a tripping of the alarm relay. The reset of the alarm relay is done locally.

### Set up/consultation

The SPECOM C network analysers are locally programmable. The parameters to configure are:

- voltage input
- nominal primary current
- average calculation period
- alarm threshold (SPECOM C40)
- width and weight of each pulse (SPECOM C40)
- speed and parity (SPECOM C30)

### Extension modules

The SPECOM C network analysers (excepted SPECOM C10) are originally equipped with one of the here below modules. Those interchangeable modules allow a permanent evolution of the product according to the customer's requirements.

- **module ER:** adds to the standard measurements, the active capacitive and reactive inductive energies as well as the clock functions and maximeter (kW, kVA, AIII).
- **module ER-485:** offers the possibilities of the module ER and an RS 485 output.
- **module ERC-2:** offers the possibilities of the module ER and two programmable relay outputs. Those programmable relay outputs can be assigned to pulse counters or alarm outputs.

### Remark

Others modules (output 4-20mA ...) are available on request.

## SPECOM M

### Aspect

- modular box: 140 x 70 x 110 (8 modules according to DIN 43880)
- fixation on DIN 46277 rail (EN 50022)
- connection on terminal block
- built-in relay protection degree: IP41
- protection degree at the terminal location: IP20

### Power supply

230 CA 50/60Hz

### Power consumption

6 VA

### Local interface

### Pulse output/alarm output

The SPECOM M40 gives the possibility to configure two relay outputs as pulse outputs or as alarm outputs. Each pulse output is assigned to the two active and reactive energy counters. The alarm outputs are programmable and can be assigned to one of the numerous parameters measured by the unit.

Any overshoot of alarm thresholds will induce a tripping of the alarm relay. The reset of the alarm relay is done locally.

### Set up/consultation

The SPECOM M network analysers (excepted SPECOM M10) are locally and remotely programmable.

The parameters to configure are:

- voltage input
- nominal primary current
- average calculation period
- alarm threshold (SPECOM M40)
- width and weight of each pulse (SPECOM M40)
- speed and parity (SPECOM M10, SPECOM M30, SPECOM M40)

## Data communication

SPECOM C30, SPECOM M20, SPECOM M30, SPECOM M40 use the MODBUS protocol on RS 485 hardware to communicate. By means of that bus, and thanks to the SPECOM L exploitation software, it is possible to transmit the measurements and other recorded data to a PC.

Initialisation and remote programming can be done from a master computer. In order to maintain a good communication quality, the master computer can not communicate with more than 32 units connected in parallel on the communication gate. The SPECOM M20, SPECOM M30, SPECOM M40 units are equipped with two RS 485 outputs, one is dedicated to the communication with a PC and the other one is dedicated to peripherals.

The physical supports of communication are:

- RS 485 hardware support (3 wires)
- transmission speed: 2400, 4800, 9600, 19200 bauds
- MODBUS protocol
- parity: with or without

## Intelligent converter RS 485/232

### Function

The converter operates as interface between a standard RS 232 link and a RS 485 communication line.

### Characteristics

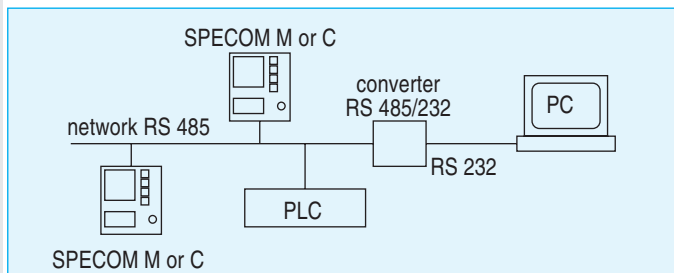

- power supply 220V AC +/- 10%
- input - serial output RS 232 (female DB9 plug)
- input - serial output RS 485 (male DB9 plug)
- mounting on DIN rail 46277 (EN 50022)
- modular box
- overall dimensions: 70 x 70 x 85 mm
- built-in relay protection degree: IP41
- protection degree at the terminal location: IP20

## Specom L exploitation software

The SPECOM L exploitation software allows the management of an electrical network. It reads at regular programmable intervals the value of the different parameters of the network. The collected parameters are synthesised on one page of screen and are also transferred to Excell files in order to be exploited later. A test of each SPECOM or peripheral can be done from SPECOM L software. It is also possible to simulate a network.

## Connection on the local network RS 485

Specom M or Specom C can be connected to a local data communication network, in association with a computer featuring a serial port and an interface adapter RS 485/RS 232
